JavaScript

JavaScript is one of the most popular scripting or programming language.

In 1995, Brendan Eich from Netscape designed and implemented a new language for the Netscape Navigator browser.

It was initially named Mocha, then LiveScript, and finally JavaScript.

JavaScript is everywhere.

• More than 94% of websites use JavaScript.

• JavaScript completes its ninth year in a row as the most commonly used programming language

The language described by these standards is called **ECMAScript**, not JavaScript. A different name was chosen because Sun (now Oracle) had a trademark for the latter name. The "ECMA" in "ECMAScript" comes from the organization that hosts the primary standard.

The original name of that organization was ECMA, an acronym for **European Computer Manufacturers Association**. It was later changed to Ecma International (with "Ecma" being a proper name, not an acronym) because the organization's activities had expanded beyond Europe. The initial all-caps acronym explains the spelling of ECMAScript

One of the features that came with ES6 is the addition of let and const, which can be used for variable declaration.

- The var keyword is used in all JavaScript code from 1995 to 2015.
- The let and const keywords were added to JavaScript in 2015.
- If you want your code to run in older browser, you must use var.

var

Variable means anything that can vary. In JavaScript, a variable stores the data value that can be changed later on.

Use the reserved keyword var to declare a variable in JavaScript.

let

- let cannot be Redeclared.
- let must be Declared before use.
- let have Block Scope.

const

- const cannot be Redeclared.
- const cannot be Reassigned.
- const have Block Scope.
